Recomputation: throughput vs allocator peak

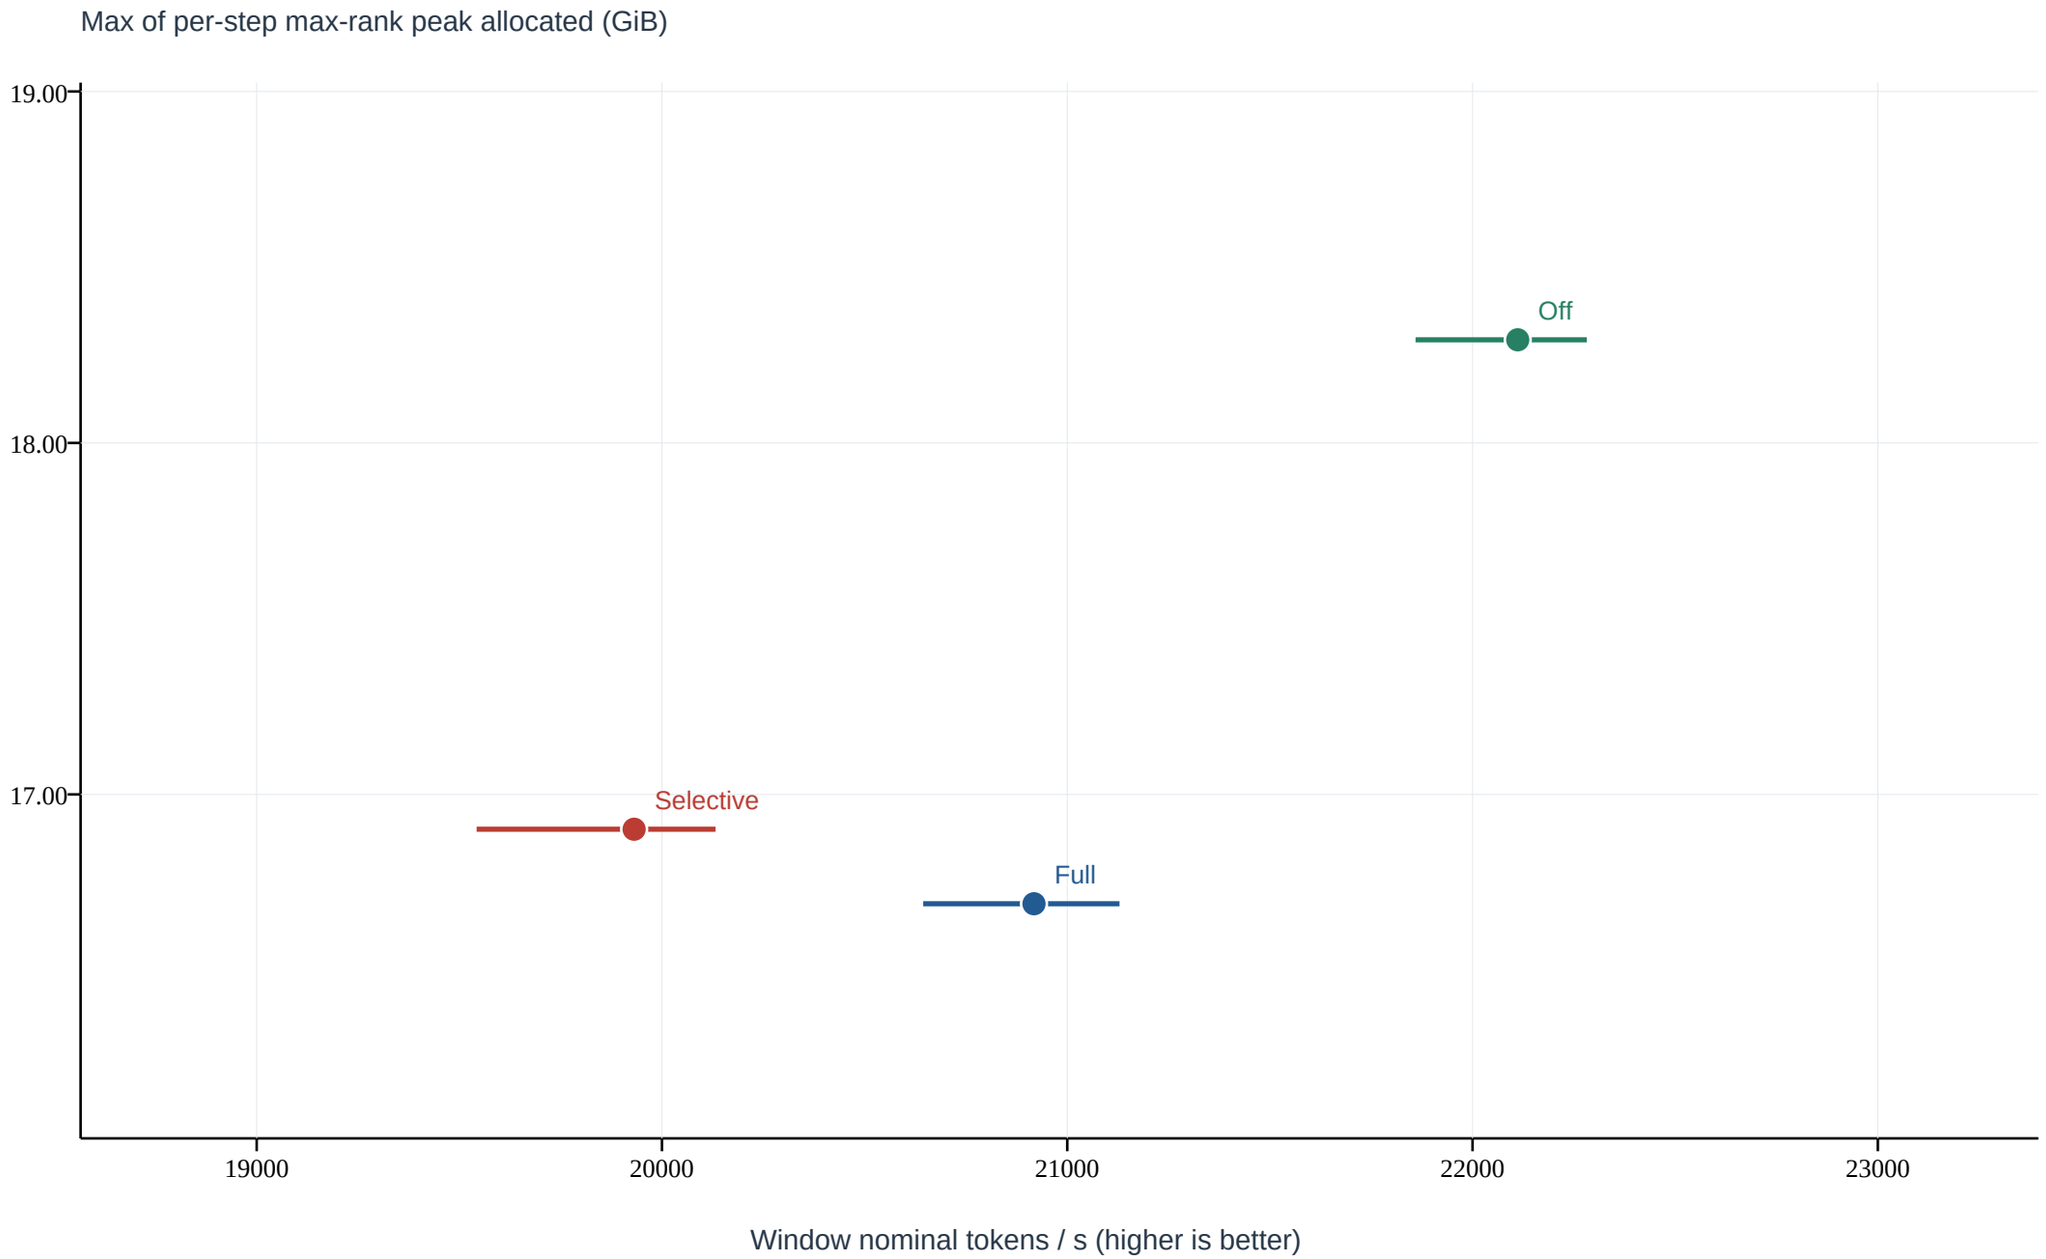
One point per strategy: window throughput = 30 x 16384 / sum(max-rank step time).

Host 125 | physical cards 4-7 | source 1a39572f

GBS 4 | LBS 1 | sequence 4096 | 10 warmup + 30 timed steps

Full (mean 0.7833 s) Selective (mean 0.8220 s) Off (mean 0.7410 s)

Bars = min-max across the 30 steps within this run; not confidence intervals. No paired reruns yet.



Bars show run-internal step ranges; overlapping ranges do not establish statistical significance.

Elapsed time is max rank local duration per update, not cross-rank wall-clock makespan.

CPU preview; website export pending.

Endpoint occupancy only; continuous exclusivity not recorded.
